

## Post-Module

Trainees repeat the acquisition of two third session audio tape recordings accompanied by measures of working alliance completed by both trainee and patient. In addition, they record their intentions at each therapist speaking turn and identify from a transcript their verbal response modes. The distribution of intentions and verbal response modes is to be compared to the pre-module distribution as a measure of potentially increased range of responses and intentions as a result of their experience. The patient measures are also completed including TOP, SEQ, and patient reaction system.
